AWS S3 STATIC WEBSITE HOSTING

Project Overview

This project demonstrates how to host a static website using Amazon Simple Storage Service (Amazon S3). It covers creating an S3 bucket, enabling static website hosting, uploading an HTML homepage, configuring public read access, and verifying the website through the S3 website endpoint.

Technology Used

- **Amazon Web Services (AWS)**
- **Amazon S3**
- **HTML**
- **AWS Bucket Policy and Permissions**

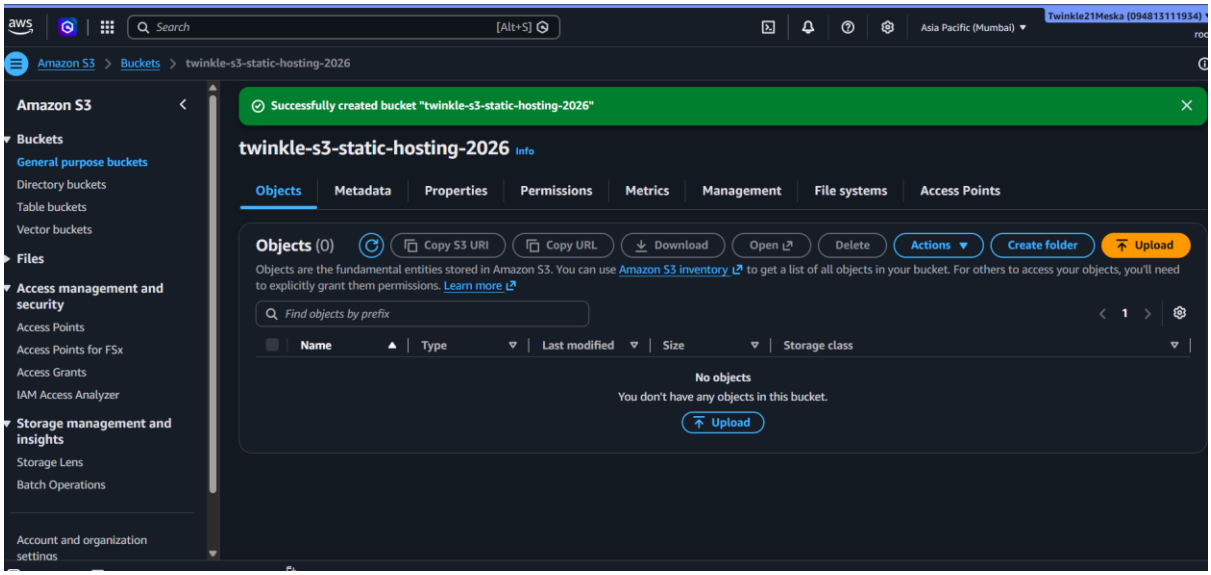

AWS Region: Asia Pacific (Mumbai) — ap-south-1

Prepared by: Twinkle Meska

Purpose: Academic Project Documentation

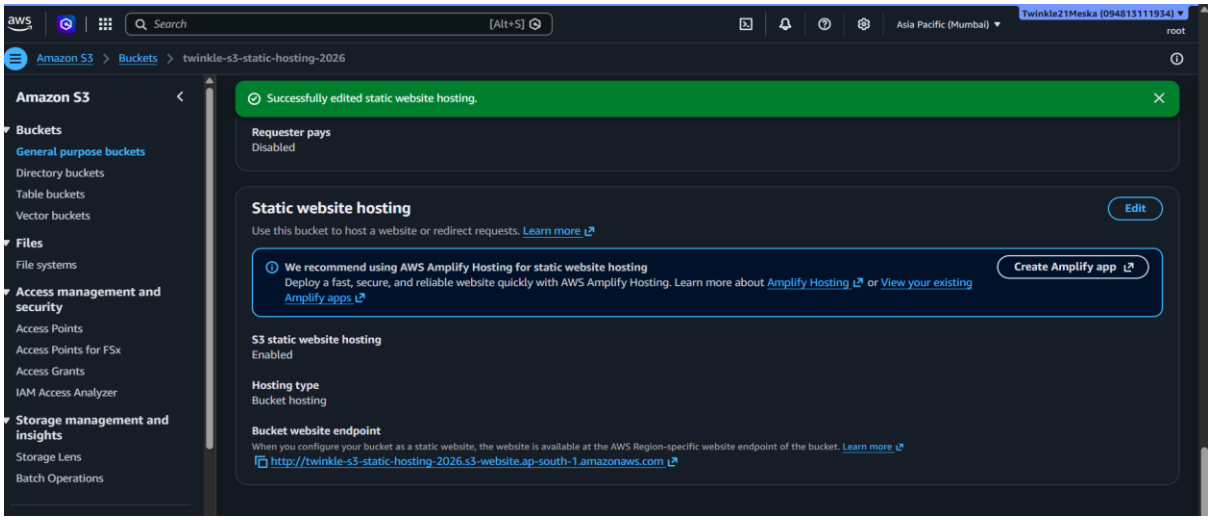

1. Amazon S3 Bucket Creation

The first step in implementing static website hosting is to create an Amazon S3 bucket. An S3 bucket is a cloud storage container used to store objects such as csv, HTML, CSS, JavaScript, and image files. This project uses a dedicated bucket to organise and store the website files required for hosting.

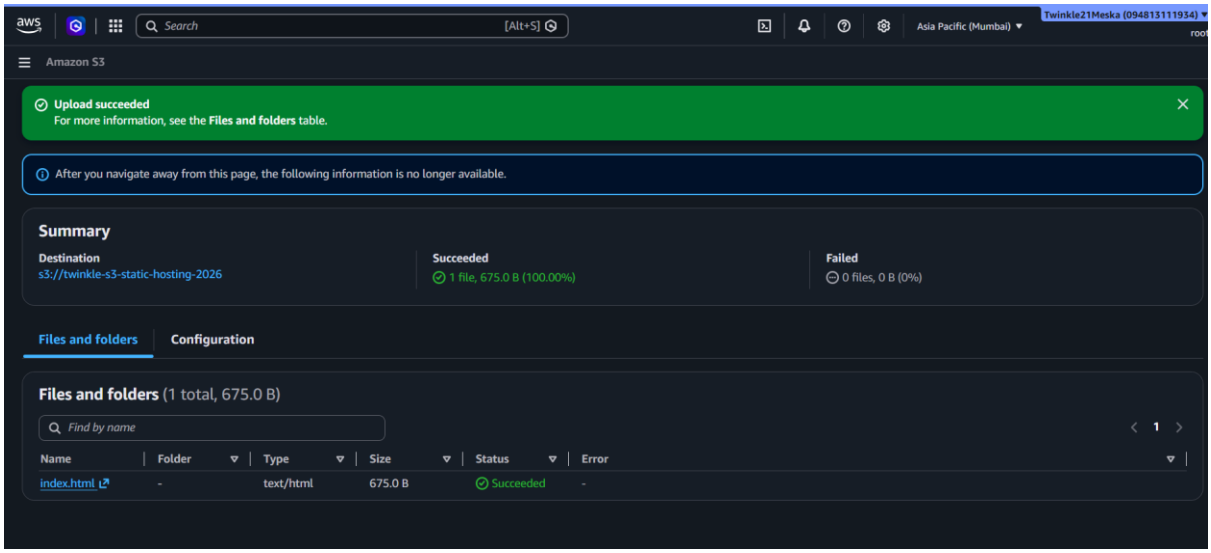

2. Enabling Static Website Hosting in Amazon S3

After creating the S3 bucket, static website hosting was enabled from the bucket's Properties tab. This configuration allows Amazon S3 to serve website files through a bucket website endpoint. The index document is configured as index.html, which acts as the main page of the website. The website endpoint is provided by AWS for accessing the hosted website.

3. Uploading the Website Files to Amazon S3

After creating the homepage, the index.html file was uploaded to the dedicated Amazon S3 bucket. This file contains the HTML structure and styling for the website. Amazon S3 stores the website content and serves it through the configured static website endpoint.

4. Testing and Verifying the Hosted Website

After enabling static website hosting and configuring the required read permissions, the website was accessed through the Amazon S3 website endpoint. The homepage displayed the welcome message, project name, and AWS Region. This confirms that the HTML file was uploaded successfully and that the static website is accessible through the configured endpoint.
